#### **ABSTRACT**

The purpose of this study was to investigate the present status of computer use and educators' attitudes toward computers in South Korean schools. The questionnaire, mailed to 300 urban and rural elementary, middle, and high schools (response rate: 61 percent) consisted of: (1) demographic data on respondents; (2) computer-using teachers' experiences with computers; (3) availability of hardware and software in schools; (4) school policy on computer education; (5) students' access to computers; (6) factors hindering computer use in schools and factors solving the hindrance problem; (7) evaluation of the results of computer education in schools; and (8) teachers' attitudes toward computers. Overall, South Korean schools have a relatively high level of technology due to the strong governmental support. Computer-using teachers' attitudes tended to be positive and the results of computer education were generally effective. A number of problems were also revealed in the survey that need to be examined further in order to provide insights into problems that occur in computer education and governmental policies. Through thoughtful policy-making and planning, along with the provision of sufficient resources, schools and teachers can expect positive outcomes of computer use in both instruction and administration. ## **ABSTRACT**

Computer uses in instruction and administration are now commonly practiced and becoming increasingly important in educational endeavors. On this point, the success of school computer education depends on how schools implement computers and how educators view the effectiveness of computers. However, little up-to-date information is available on the use of computers and educators' attitudes toward computers in Korea.

The purpose of this research was to investigate the present status of computer use and educators' attitudes toward computers in Korean schools. To serve the purpose, a survey was conducted in November, 1994.

Overall, Korean schools do have relatively a large number of hardware and a large amount of software due to the strong governmental support. Computer-using teachers showed relatively positive impression on the results of computer education. In addition, computer-using teachers' attitudes toward computers tended to be positive.

In contrast with such satisfactory findings, some disappointing results were found, which can also provide valuable insights into the policy-making. Data collected now at the time of the initial use of computers in Korea will be useful for the Ministry of Education to set up a policy to guide computer education.

## INTRODUCTION

During the past few years, the use of computers in education showed a remarkable increase in many countries. Educators believe that computers offer tremendous potential for improving educational quality and for revolutionizing educational processes. On the basis of the belief, computer uses in instruction and administration are now commonly practiced, and are becoming increasingly important in educational endeavors. However, as is often the case, the increased use of technology does not necessarily justify itself on sound pedagogical grounds. Like any other technological innovation, computers need to be correctly implemented and properly supported. On this point, the success of computer education depends on how educators use computers and how they view its effectiveness. Thus, it is necessary to collect information about the ways in which computers are being used in schools, and to understand educators' attitudes and opinions toward computers.

In Korea, the Ministry of Education has established a plan to strongly support the computer education in schools. According to the plan, at least 31 computers will be provided to every school in Korea by the end of 1996, and 90 pieces of educational software will be developed each year and provided to school by the end of 1990s.

Regardless of such governmental support, however, computers are still viewed as "new" educational media. Also, up-to-date information is hardly available on the use of computers and educators' attitudes toward computers in Korean schools. In 1989, a research was conducted to examine how schools used computers and how educators perceived computers (Oh, Sohn and Lee, 1989). Since then, no one has conducted a research for such purpose. On this

-1-3

point, there is a great need to conduct a research on the present status of computer uses and educators' attitudes toward computers in Korean schools.

# **OBJECTIVES**

The purpose of this research was to investigate the present status of computer use and educators' attitudes toward computers in Korean schools. In order to serve the purpose of the research, the following seven objectives were set and research questions were raised for each objective:

- 1. To survey computer-using teachers' experiences with computers
  - What kind of knowledge do teachers have on computers?
  - What kind of computer-related training have teachers received?
- 2. To investigate the availability of hardware and software in schools
  - How many computers do schools have?
  - What kind of computers do schools have?
  - What kind of graphic boards do schools have?
  - Where are the computers located?
  - How much software do schools have?
  - What kind of software do schools have?
- 3. To assess school policy on computer education
  - What is the most important goal for computer use in schools?
  - What kind of support do schools provide for computer education?
  - How often policy-related activities occur in schools?
- 4. To examine students' access to computers
  - What grade level of students use computers?
  - When can students use computers?
  - How often do students use computers?
  - In what major subject areas are computers used?
  - What are the major curricular topics covered in computer education?
- 5. To identify factors hindering computer use in schools and factors ameliorating the hindering factors
  - What is the most critical problem hindering schools from using computers?
  - What should be considered first to solve the problem?
- 6. To sum up computer-using teachers' evaluation on the results of computer education in schools
  - What kind of influence does computer education have on the following aspects:
    - teachers' teaching load
    - teachers' motivation toward teaching
    - teachers' attitudes toward computers
    - students' achievement
    - students' motivation toward learning

- 7. To survey computer-using teachers' attitudes toward computers
  - What kind of opinions do teachers have on the following topics: usefulness of computers need for learning about computers influence of computer-related activities on human relationship gender equity in computer education

## **METHODS**

The major research method was a survey. The survey questionnaire used in this research was adapted from other related studies (Becker, 1988, 1991; Oh, et al., 1989), and modified in a way to be more appropriate for the purpose of research.

The questionnaire consisted of 8 parts. Each included questions on one of the following topics: demographic data on respondents, computer-using teachers' experiences with computers, availability of hardware and software in schools, school policy on computer education, students' access to computers, factors hindering computer use in schools and those ameliorating the hindrance, evaluation on the results of computer education in schools, and teachers' attitudes toward computers.

The survey was conducted in November, 1994. The questionnaire was mailed to 300 schools. The schools were randomly selected according to the level (i.e., elementary, middle, and high) and the location (i.e., urban and rural). The response rate was about 61%: 182 out of the 300 schools responded to the questionnaire. Survey questionnaire was mailed to the principals of the selected schools, and each principal was asked to select one computer-using teacher in his/her school, who will fill out the survey questionnaire.

## RESULTS

## 1. Demographic Data

Demographic data about schools and teachers in the sample are shown in Tables 1 and 2. Demographic data on schools were gathered in terms of the level, location and type of schools. The total number of schools responded to the survey questionnaire was 182.

Demographic data on teachers were also gathered in terms of gender, age and major subject area. As shown in Table 2, about three fourth of teachers who are responsible for school computer education turned out to be male. Concerning the age of computer-using teachers, the average was 32 ranging from 23 to 48. Teachers' major subject areas were mostly home economics and technology(53%) and science(22%).

Classi	fication	Number of Schools
Tota	1	182 (100.0)
School Level	Elementary	75 (41.2)
revei	Middle	55 (30.2)
	High	52 (28.6)
School Location	Urban	91 (50.0)
Location	Rural	91 (50.0)
School Type	Public	140 (76.9)
Type	Private	42 (23.1)

Gender	Number of Teachers
Male	142 (78.0)
Female	40 (22.0)
Total	182 (100.0)

# 2. Computer-Related Experiences of Teachers

## Teachers' Knowledge on Computers

Computer-using teachers were asked to estimate the level of their understanding on 12 topics of knowledge. About most topics, a large proportion of teachers in the sample reported that they understand the topics either "a little" or "well" (See Table 3).

Exceptions were found in "computer-related crime", "use and development of database", and "development of programs". Given the great interest in networked information through telecommunication, more attention needs to be paid to "computer-related crime" and "use and development of database". Concerning teachers' knowledge on "development of programs", although the Ministry of Education encourages teachers' development of software with rewards for the effort, over 50% of teachers reported that they still do not know anything about program development. Training courses need to be organized to teach these topics.

When the responses were compared according to the school level, no big difference was found in teachers' knowledge on computers among the elementary, middle and high schools.

# Computer-related Training Experiences

With governmental support, computer-related training courses are provided to teachers. There are three types of training courses with a little variation in the courses: 30 hour-, 60 hour- and 120 hour-training. The 30 hour-training deals with the topics such as needs for computer use, basic concepts of computers and computer-assisted instruction, DOS, wordprocessing, and programming. The 60 hour- and the 120 hour-training courses contain about the topics taught in the 30-hour training at a higher level, and the topics on the uses of other application programs such as spreadsheets and databases.

As shown in Table 4, over 65% of teachers in the sample have taken either 60-hour or 180-hour training courses. However, over 10% of teachers reported that they had no chance to take a computer-related training course, although they were selected as computer-using teachers in their schools.

When teachers' training experiences were compared according to the school level, high school teachers had more opportunities to take 180-hour training courses than other teachers. When the data were reanalyzed according to the location and type of schools, computer-related

training experiences of teachers turned out to be very similar across rural and urban schools, and public and private schools. This indicates that almost equal opportunities for computer training are provided to teachers across the location and the type of schools.

# 3. Availability of Computer Hardware and Software in Schools

## Computer Availability

For the instructional use of computers, the Korean government is carrying out a plan for computer education. According to the plan, at least 31 computers are to be provided to every school by the end of 1996. With such governmental support, as shown in Tables 5 and 6, there has been much increase in the average number of computers in each school, and schools now have relatively a large number of computers for instruction.

However, the major kind of computers available in schools is mostly IBM or IBM compatible XT, which does not have a hard diskdrive. Also, there are a large number of students per class in schools: about 60 students in average. On this point, the kind and the number of computers in schools are not satisfatory for active uses of computers in schools.

For administrative use of computers, teachers informed that each school has at least one computer in average. A slight difference was found in the average number of computers for administrative work among schools: high schools tend to have more computers than other schools.

In contrast with these findings, about 6% of the 182 teachers in the sample reported that their schools have no computer to be used for instructional use, and about 7% of schools were without any computer for administrative work.

In addition, schools were compared according to the location and type. For instructional use, urban schools tended to have more computers than rural schools; about 30 computers for urban schools and 22 computers for rural schools in average. Because of the difference in the average number of students per class in urban and rural schools, the difference in the number of computers may not cause less use of computers in schools. Also, when public schools were compared with private schools, private schools tended to have more computers than public schools; the average number of 32 computers for private schools and 27 computers for public schools. For administrative use, no big difference was found between urban and rural schools and between public and private schools.

# Kind of Graphic Board

For both instructional and administrative uses, high schools tend to have a little more color graphic boards than either elementary or middle schools (See Table 7). But, still only a limited number of color computers are available in schools.

Kind of Use	Kind of Graphic Board		Average Number of Computers						
	Graphic Board	All Cases	All Cases School		ls				
			Elementary	Middle	High				
Instructional	Black/White	23.12 (92)	20.00 (92)	26.16 (61)	24.38 (80)				
Üse	Color	3.59 (62)	3.41 (26)	1.98 (31)	5.56 (62)				
Administrative	Black/White	0.86 (7)	0.71 (6)	0.78 (3)	1.17 (7)				
Use	Color	1.42 (7)	0.88 (4)	1.40 (4)	2.21 (7)				

# Computer Location

Most computers are located in the computer lab., as indicated in Table 8. Also, it is worth pointing out the following two kinds of findings: for instructional use, unlike other schools, elementary schools have an average number of one computer in a classroom; and for administrative use, schools have an average of one computer in the office of school affairs. Some teachers reported a language lab. and a countriling room as other computer locations.

( ) ( )									
Location	Average Number of Computers								
	All C	ases	School Levels						
			Elementary	Middle	High

Other	ი. 25	(7)	0.12 (3)	0.27 (6)	0.40 (7)				

#### Software Availability

Since 1989, there has been a big increase in the amount of instructional software available in schools (See Table 9). This is due to the governmental policy to support the development and distribution of educational software: a large amount of software is developed every year and distributed to schools by the end of 1990s. On the basis of such policy, 497 pieces of educational software have been developed by the end of 1994 and distributed to schools. However, regardless of such increase, there are still many schools that do not have any software to use: 30% of teachers in the sample reported that their schools do not have any software for instruction.

Unlike the software availability for instructional use, in the case of software for administrative use, a surprising result was found; there was a significant decrease in the amount of software available in elementary schools. In addition, 14% of schools in the sample reported that they do not have any software for administrative work.

When the software availability was compared according to the school level, a great discrepancy was found between elementary schools and other schools in the average amount of instructional software.

In addition, a comparison was made between schools across different locations and types. For instructional software, when the average amount of software was compared between urban and rural schools, it was found that rural schools have much more software than urabn schools: about 74 pieces in average for rural schools and 45 for orban schools. When public

-8- 10

schools were compared with private schools, it was found that public schools have more software than private schools: about 63 pieces for public schools and 34 for private schools. For administrative use, it was reported that an average number of 4 or 5 pieces of software are available in schools across different locations and types.

Concerning the kind of software for instructional use, software for mathematics and science took the majority. For administrative use, unlike other types of software, schools have one or two pieces of word processing software.

# 4. School Policy on Computer Education

# The Most Important Goal for Computer Use in Schools

About half of teachers in the sample reported "teaching students about computers" as the most important goal for computer use in their schools (See Table 10).

A notable increse was found in schools, which have no specific goal for their school computer use: more than twice as many schools as those in the 1989 research reported "no specific goal" in the present research. Because the functions of computers used in schools

are very limited, schools seem to face difficulty in using computers. The increase may be due to such difficulty.

On the other hand, a significant increase was found in schools, which emphasize the use of computers for administrative work. Especially, this was apparent in high schools.

⟨Table 10⟩ Major Goal for Computer Use in Schools
( ): valid percent

Goa1	Number of Schools								
	A11 C	Cases		School Level	ls				
	1989	1994	Elementary	Middle	High				
To Teach Students about Computers	92 (69.2)	91 (50.0)	36 (48.0)	30 (54.5)	25 (48.1)				
To Use Computers in Classes in Regular Curriculum	18 (13.5)	19 (10.4)	11 (14.7)	3 (5.5)	5 (9.6)				
To Conduct School Administrative Work	4 (3.0)	30 (16.5)	8 (10.7)	7 (12.7)	15 (28.8)				
Because Government Provided Computers (No Specific Goal)	14 (10.5)	42 (23.1)	20 (26.6)	15 (27.3)	7 (13.5)

Total	133 (100.0)	182 (100.0)	75 (100.0)	55 (100.0)	52 (100.0)				

## Administrative Support from Schools

As shown in Table 11, 34% of teachers in the sample indicated "purchasing computers and com uter-related facilities" as the most important administrative support from schools. The next most frequently provided support is "providing computer training courses"(21.6%), followed by "equipping computer laboratory"(18%).

When responses were compared according to the school level, in high school almost twice as many teachers as those in elementary and middle schools reported "the purchase of computers and computer-related facilities" as the primary support. This may be because the functions of computers available in schools are very limited in performing the computer-related activities needed in high schools, and there is a great need to equip other related facilities such as LAN, OHP LCD palette and printers. In this category, a difference was also found between the 1989 research and the 1994 research. It is also noticeable that twice as many schools as those in the 1989 research reported "equipping a computer laboratory" as the major administrative support in the 1994 research.

⟨Table 11⟩ Administrative Support

( ): valid percent

					Tru percent

# Policy-related Activities on Computer Education

Teachers were asked about the frequency and the kind of activities taking place in schools. Their responses are summarized in Table 12.

Concerning parents' support, most teachers reported that their schools have never received such support. Especially, all the high school teachers in the sample informed that their schools have never received any support from parents. This may be because of the strong gorvernmental support.

Concerning principals' encouragement for computer use, most teachers reported that their schools do receive such support. However, it is worth mentioning that about one fourth of high schools in the sample have never received such support from their principals. It may be because the major interest of high school principals is in the college entrance examination over anything else.

For other types of activities (i.e., formation of an interest group, periodic evaluation on computer education, reduction of teaching load, purchase of related materials), in contrast with the 1989 research, the 1994 research showed either slight or big increases in the answer, "never". Especially, it is surprising to find out the fact that over 96% of the schools in the sample had never reduced teaching load of teachers who are responsible for computer uses in schools. This might happen because of the disappointment of teachers and

school administrators on the present status and problems of computer education. On this point, there is a great need for administrative support, that can provide strong incentives toward computer use in schools.

# 5. Students' Access to Computers

## Major Grade Level Using Computers in Schools

Table 13 summarizes the answers of teachers regarding the major grade level of computer users. 77% of teachers answered that their schools provide opportunities for computer education to students at specific grade levels.

For elementary schools, about 60% of teachers in the sample reported that the 4th, 5th and 6th graders are the primary users of computers. This is consistent with the government policy that recommends elementary schools to provide computer education to  $4^{\circ}6$  graders. For the other graders, there seems to be almost no chance to use computers.

For middle schools, among the schools in which specific graders can use computers, 36% reported the 7th graders as the major users of computers, and 22% pointed out the 7th and 8th graders as primary users of computers. It seems that 9th graders have almost no chance to use computers.

For high schools, the grade levels using computers varied a lot. It is, however, noticeable that the 12th graders were less likely to use computers. It may be because of the time schedule tightly fixed for the preparation for college entrance examination.

Grade Level	Number of Schools					
	All Cases	School Levels				
		Elementary	High			
Every Level	37 (22.8)	10 (13.9)	11 (23.4)	16 (37.2)		
Specific Level	125 (77.2)	62 (86.1)	36 (76.6)	27 (62.8)		
No Answer	20	3	8	9		
Total	182 (100.0)	75 (100.0)	55 (100.0)	52 (100.0)		

# Available Time to Use Computers in Computer Laboratory

Teachers were asked to check all the time period in which the computer laboratory is available. Those who did not answer to this question reported that their schools do not have many computers to use, and thus no attempt has been made for computer education.

Among the rest of schools, the most common time to use computers is during the extracurricular hours with the exception of high schools (See Table 14). For high schools, this might happen because of their emphasis on the college entrance examination.

For computer education class, it is the governmental policy to have each school decide whether they select computer education as a part of regular curriculum. Because of this policy, about half of the schools in the sample reported that they use the computer lab. during the class hour of computer education, and the other half not using the computer lab. during the class hour.

Concerning the use of computers in regular classes, it seems that schools should be more encouraged to use computer-assisted instructional programs and other application programs in their regular classes as tools for teaching and learning.

Among the teachers who reported that their schools use computers during other time, 92% reported lunch hour.

## Average Hours of Students' Computer Use

Table 15 summarizes the average hours of students' computer use. About 40% of teachers informed that students in their schools can use computers for 1 or 2 hours per week. In contrast, about 19% of teachers reported less than 1 or 2 hours per semester. The conflict between the large number of students and the limited amount of computers in schools seems to hinder schools from using computers more often than now. When schools were compared according

to the level, it seemed that elementary schools use computers relatively more often than secondary schools.

## Major Subject Area Using Computers

Teachers were asked about the subject area in which computers are used the most frequently. According to their responses, the most common subject area in which computers are used is home economics and technology (See Table 16). The next most frequently used subject areas are mathematics and science.

It is noticeable that elementary schools use computers most often in mathematics, while almost none of middle and high schools emphasize mathematics as the major subject area.

(Table 16) Major Subject Area Using Computers

Subject Area	Number of Schools					
<u> </u>	All Cases	School Levels

## Major Curricular Topics Covered in Computer Education

As shown in Table 17, teachers in the sample reported the most frequestly covered topics in computer education as "using DOS"(24.5%), "dealing with computers"(20.4%) and "using CAI programs"(20.4%). It is also worth indicating that relatively less emphasis is given or programming-related topics and no emphasis on flowcharting. This might happen due to the change in computer-related curriculum.

A surprising result was found in the topic, "dealing with computers". Although the topic is about basic knowledge of computers, about 21% of high school teachers reported it as the most important curricular topic in computer education. This might happen because of the lack of opportunities for students to learn about computers.

Concerning the use of CAI programs, a large proportion of elementary and middle school teachers reported their interest in the topic. In contrast, at the high school level, almost no school informed "using CAI programs" as the most important topic of computer education.

Topic .		Number of S	chools

# 6. Factors Hindering Computer Use/Factors Ameliorating the Hindrance

# Hindering and Ameliorating Factors on Computer Use for Instruction

Teachers were asked about the most critical factor hindering schools from using the computer for instruction, and the most important factor ameliorating the hindrance. The responses are summarized in Tables 18 and 19.

Concerning the problem, 20% of the teachers believed that the major problem is the lack of qualified teachers. Although "the lack of qualified teachers" was reported as the most critical problem, only 1.2% pointed out the lack of opportunities for computer training as the problem. The next most frequent responses were the lack of computers(14.2%) and the limited functions and memeory of the computers(14.2%).

When teachers' answers were compared according to the school level, a discrepancy was found between high schools and other schools. High school teachers tended to view school policy and change of time schedule to be very important. In contrast, while elementary and middle school teachers attached importance to the need for qualified teachers, high school teachers took this issue relatively less important.

Concerning the most important factor to solve the problem hindering the school computer use for instruction, overall, teachers viewed all the listed factors to be important although there were some differences found in the frequencey of answers to some factors.

The most frequently indicated factors (i.e., "not having enough compouters to use" and "not having computer hardware with enough memory and functions") were related to the purchase of computer hardware. This finding was similar to all the schools across different levels. More high school teachers viewed school policy to be important than did teachers in elementary and middle schools. More elementary schoool teachers viewed the change of time

scheduling as a crucial factor to solve the problem in school computer use than did teachers in other schools. This may be due to the teaching load of teachers in elementary schools, who should teach almost all the subject areas.

# Hindering and Ameliorating Factors on Computer Use for Administration

Like the above questions on the use of computers for instruction, teachers were first asked about the most critical factor hindering schools from using computers for administration. The responses are summarized in Table 20. Concerning the problem of computer use, about 26% of teachers believed that the major problem is the lack of qualified teachers. The next most frequently answered reasons were the lack of computer hardware and software.

When schools were compared according to the level, a discrepancy was found between high schools and other schools. High school teachers tended to view the purchase of computer-related facilities to be important more than did other teachers. This may be due to the need for the purchase of LAN, printers, OHP, OHP LCD palette, etc. in teaching advanced level of knowledge on computers.

In addition to the above question, teachers were also asked about the most important factor that should be considered to solve the problem hindering the school computer use for administration. The responses are summarized in Table 21. Overall, teachers viewed all the listed factors to be important although there were some differences found in the frequency of answers on some factors.

The most frequently indicated factor was the need for qualified teachers. The next most frequently cited factors were the purchase of hardware and software. It is worth noticing that more high school teachers viewed administrative support from schools and administrators' understanding on computer education to be important than did teachers in elementary and middle schools.

## 7. Evaluation on The Results of Computer Education

Teachers were asked to evaluate the results of computer education in five aspects. The answers are summarized in Table 22. The teachers whose schools do not have any computer or do not use computers often did not answer.

Concerning the influence on teachers' teaching load, most teachers reported that the load has been increased either very much or a little. Especially more middle school teachers reported a significant increase of teaching load than did teachers in elementary and high schools.

Concerning changes in teachers' motivation and attitudes toward teaching, most teachers evaluated as being "enhanced a little". Although every teacher may agree with the usefulness of computers, they may feel difficulty in using computers because of the limited number of

computers compared to the large number of students, and because of the increase in teaching load.

About the influence of computer use on students' achievement, many teachers evaluated as being "enhanced a little". More systematic uses of computers than now are needed, followed by detailed evaluation. About the changes in students' motivation toward learning, most teachers answered as either "being enhanced much" or "being enhanced a little".

Overall, the results of computer education were positively rated at all levels of schools.

# 8. Computer-using Teachers' Attitudes Toward Computers

In order to assess teachers' attitudes toward computers, 7 questions were raised. The questions can be rearranged into four categories: usefulness of computers, need for acquiring computer-related experiences, influence of computer use on inhuman relationship, and gender equity. The summary of the responses is presented in Table 23.

About the usefulness of computers, two questions were raised on the usefulness of computers in enhancing educational quality and usefulness of computers limited to only several subject areas. Overall, teachers showed positive attitudes toward the usefulness, and viewed computers to be usable in many areas.

Question	Answer	Number of Teachers				
		All Cases	L	evel of Sch	ools	
			Elementary	Middle	High	
Computers are	Strongly Agree	90 (49.5)	35 (46.7)	25 (45.5)	30 (57.7)	
useful tools that can enhance	Slightly Agree	90 (49.5)	39 (52.0)	29 (52.7)	22 (42.3)	
the quality of school education.	Slightly Disagree	2 (1.0)	1 (1.3)	1 (1.8)	0	
	Strongly Disagree	0	0	0	0	
Computers are	Strongly Agree	12 (6.6)	6 (8.0)	3 (5.5)	3 (5.8)	
Computers are useful only for several subject	Slightly Agree	54 (29.7)	24 (32.0)	15 (27.3)	15 (28.8)	
areas.	Slightly Disagree	20 (11.0)	7 (49.3)	7 (12.7)	6 (11.6)	
	Strongly Disagree	96 (52.7)	38 (50.7)	30 (54.5)	28 (53.8)	
I want to take	Strongly Agree	124 (68.1)	56 (74.7)	31 (56.4)	37 (71.2)	
computer training courses	Slightly Agree	44 (24.2)	17 (22.7)	16 (29.1)	11 (21.2)	
to learñ about computers more.	Slightly Disagree	9 (5.0)	1 (1.3)	5 (9.0)	3 (5.8)	
	Strongly Disagree	5 (2.7)	1 (1.3)	3 (5.5)	1 (1.8)	
Every teacher	Strongly Agree	140 (77.0)	66 (88.0)	33 (60.0)	41 (78.8)	
should learn about computers.	Slightly Agree	41 (22.5)	9 (12.0)	21 (38.2)	11 (21.2)	
	Slightly Disagree	1 (.5)	0	1 (1.8)	0	
	Strongly Disagree	0	0	0	0	
Computer related activities may	Strongly Agree	1 (.5)	1 (1.3)	0	0	
cause inhuman relationship.	Slightly Agree	103 (56.6)	45 (60.0)	27 (49.1)	31 (59.6)	
relationship.	Slightly Disagree	37 (20.4)	18 (24.0)	12 (21.8)	7 (13.5)	
	Strongly Disagree	41 (22.5)	11 (14.7)	16 (29.1)	14 (26.9)	
Computer Education is more	Strongly Agree	4 (2.2)	0	3 (5.5)	1 (1.9)	
limportant for	Slightly Agree	8 (4.4)	1 (1.3)	6 (10.9)	1 (1.9)	
male students than for female students.	Slightly Disagree	15 (8.2)	6 (8.0)	5 (9.1)	4 (7.7)	
Students.	Strongly Disagree	155 (85.2)	68 (90.7)	41 (74.5)	46 (88.5)	
Female students can learn about	Strongly Agree	2 (1.1)	1 (1.3)	1 (1.8)	0	
can learn about computers more leasily than male	Slightly Agree	26 (14.3)	11 (14.7)	5 (9.1)	10 (19.2)	
students.	Slightly Disagree	45 (24.7)	15 (20.0)	22 (40.0)	8 (15.4)	
	Strongly Disagree	109 (59.9)	48 (64.0)	27 (49.1)	34 (65.4)	

About the need for acquiring computer-related experiences, two questions were presented on the need for taking computer-related training courses and learning about computers. Most teachers showed either strong or slight agreement on the issues: more strong agreement was found than slight agreement.

Concerning the influence of computer use on inhuman relationship, one question was raised. Nearly half of the teachers reported slight agreement on the influence of computer use on inhuman relationship. However, the other half of the teachers in the sample showed strong or slight disagreement.

Concerning gender equity, teachers generally viewed computers to be important for both gender groups. They also viewed students to have similar abilities to learn about computers regardless of their gender.

# DISCUSSION

Undoubtedly, computers have been playing an important role in education. However, the importance of this role, to a large extent, depends on how educators use computers and how they view the effectiveness of computers. Although a fairly large body of research has been conducted in the United States on school use of computers and educators' attitudes toward computers, there is little information known on this topic in Korea. Because computer use in schools is a new area of education in Korea, it is an important topic that should be systematically explored. Teachers should not blindly accept the technology, but should consider carefully all aspects of the implementation of the technology.

The results of this research have provided valuable information regarding how Korean schools implement computers and how computer-using teachers perceive computers as instructional and administrative tools.

Overall, for instruction, Korean schools do have relatively a large number of hardware (i.e., about 28 computers in average) and a large amount of software(i.e., about 57 pieces in average) due to the strong governmental support. For administration, there has been no governmental support provided to schools. However, most schools have at least one computer to use for administrative purposes. When the data were compared according to the school level, only modest differences were found among elementary, middle and high schools with some exceptional cases. Concerning the results of computer education, computer-using teachers showed relatively positive impression on the results except the increase of teaching load. Also, computer-using teachers' attitudes toward computers tended to be positive.

In contrast with these satisfactory findings, some disappointing results were also found in several important factors. Those results need to be examined further in order to get some insights into problems that educators may face in performing computer education, and things to be considered in the development of governmental policy and plan.

First, the kind of computer hardware available in schools seem to cause serious problems in school computer education. Most of computers are IBM or IBM compatable XTs without hard diskdrives. Because the functions of these computers are very limited, the computers cannot perform the activities that teachers want their students to do. Also, with the average of 60

students per class, it is very difficult to handle the whole class with floppy diskettes. On this point, schools need to equip better computers with hard diskdrives.

Second, about the amount of software available in schools, Korean government provides a strong support for the development and distribution of educational software. On the basis of the support, 497 pieces of educational software have been developed by the end of 1994, and schools can make copies of the software for free. However, about 30% of teachers in the sample reported that their schools do not have any software to use. This indicates a serious problem in the way to distribute the software. A more detailed investigation needs to be made on this problem.

Third, Korean government has built a rewarding system to encourage teachers' development of software. However, over 60% of computer-using teachers in this research informed that they know nothing about software development. More attention needs to be given to computer-related training to teach this topic in a more systematic manner.

Fourth, when teachers were asked to point out the most important problem hindering active uses of computers and the most important factor ameliorating the problem, a large proportion of teachers indicated "the lack of qualified teachers" as the most important one. It needs to be examined carefully about whether computer-related training opportunities are provided enough to teachers who are enthusiatic about computer uses.

Fifth, concerning the school policy on computer education, the comparison of present research against the 1989's revealed an unexpected decrease in some policy-related activities (i.e., formation of an interest group, periodic evaluation on computer education, reduction of teaching load and purchase of computer-related materials). Especially, it was noticeable that in more than 96% of schools, the teaching load of computer-using teachers has never been reduced. More careful consideration needs to be provided on the development of school policy, so that computer uses can be activated in schools.

Sixth, careful attention needs to be paid to the way computers are used in schools. Computers can be used not only in computer education classes but also in regular classrooms. Efforts need to be provided to inform teachers of the various ways of implementing computers in teaching.

These findings provide valuable insights into the policy-making. As schools increase their utilization of computers, educational decision-makers need an information base concerning how schools use computers and what attitudes educators have toward computers. Successful uses of computers in schools require the careful development of policy and the implementation of plans. Through thoughtful policy-making and planning along with sufficient resources, schools and teachers can expect positive outcomes of computer use in both instruction and administration. Data collected now at the time of the initial use of computers in Korea will-be useful for the Ministry of Education to set up a policy to guide computer education.

In addition, it can be expected that in the near furture, computer education in Korean schools will grow fast. In order to maintain up-to-date information on how schools use computers, longitudinal data will have to be collected. Also, at the beginning stage of governmental promotion to set up policies for computer education in Korean schools, policy analysis studies need to be conducted focusing on cost and efficacy.
